

HWRS 561b: Physical Hydrogeology II

Pore scale fluids distribution

Agenda:

1. Air-water interface
2. Capillarity

Air-water system in capillary tubes

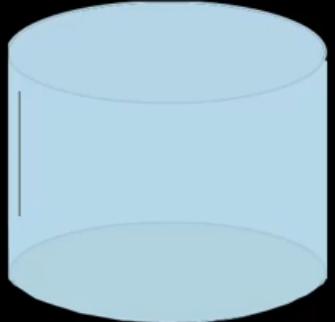

1. Why does the water try to hold together?
2. Why does the water not wet the surface?

Air-water system in capillary tubes

HWRS 561b

SURFACE
TENSION

Link to the video: <https://youtu.be/zMzqiAuOSz0>

Air-water system in capillary tubes

- Two and three phase systems: water, oil, air
- *Interfacial tension (cohesive forces between fluid molecules)*

Typical values of surface tension:

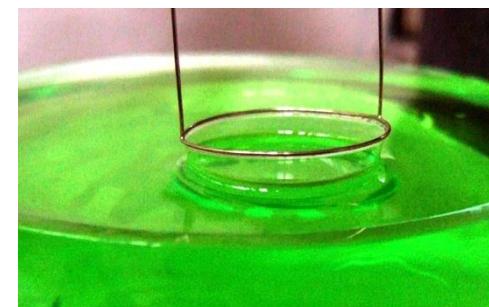

air-water	0.072 N/m
oil-water	0.20 N/m
oil-water w/ soap	0.0001 N/m

How to measure interfacial tension?

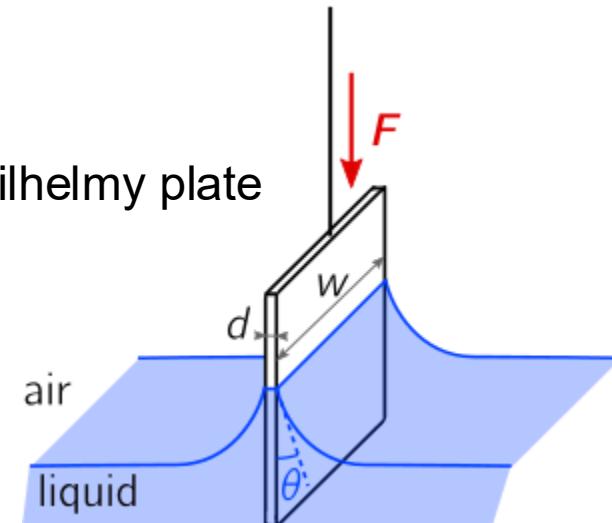

Drop weight method

ring method

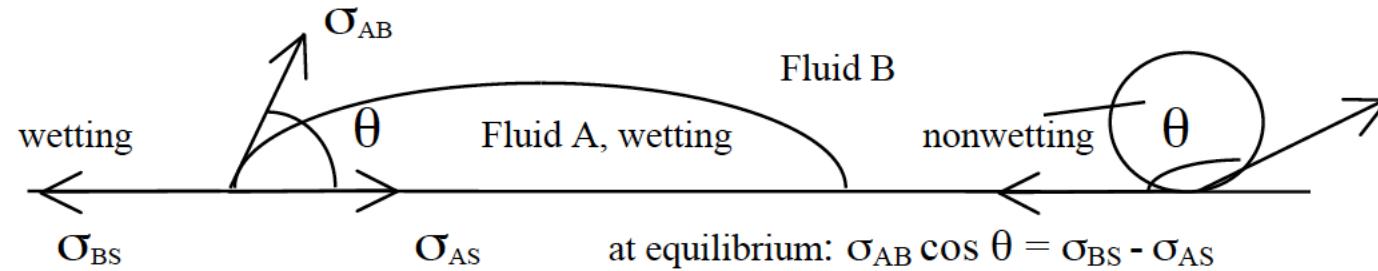

Wilhelmy plate

Air-water system in capillary tubes

- *Wettability (adhesive forces between the fluid and solid surface)*

$\theta < 90^\circ$: fluid A is wetting with respect to fluid B on the solid S

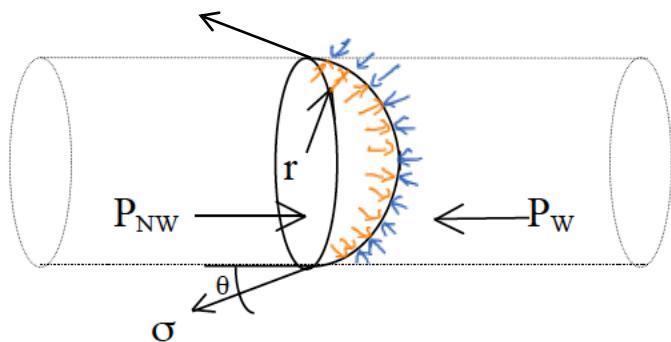

$\theta > 90^\circ$: fluid A is nonwetting with respect to fluid B on the solid S

Wettability is a function of the fluid properties, soil properties, and history of contact. For most soils, the relative wettabilities are: water > oil > air

Recommended video for the concepts of *viscosity, cohesive and adhesive forces, surface tension, and capillary action* https://www.youtube.com/watch?v=P_jQ1B9UwpU

Air-water system in capillary tubes

Capillary pressure (difference between the nonwetting and wetting phase pressures)

Force balance at equilibrium:

$$2\pi r \sigma \cos \theta = \pi r^2 P_{nw} - \pi r^2 P_w \Rightarrow P_{nw} - P_w = \frac{2\sigma \cos \theta}{r}$$

$\Rightarrow P_c = \frac{2\sigma \cos \theta}{r}$ Young-Laplace equation.

1° More general equation for any nw-w interface: $P_c = \sigma \left(\frac{1}{r_1} + \frac{1}{r_2} \right)$

2° For a perfectly wetting fluid, $P_c = \frac{2\sigma}{r}$ ($\theta=0$)

For the capillary tube:
 $r_1=r_2=r/\cos\theta$

Air-water system in capillary tubes

Capillary pressure

Pressure jump across a fluid-fluid interface

Young-Laplace Equation

Pressure jump across a fluid-fluid interface is determined by interfacial tension + geometry of the interface (radii of the curvature)

Optional, but strongly encouraged, Mini-project

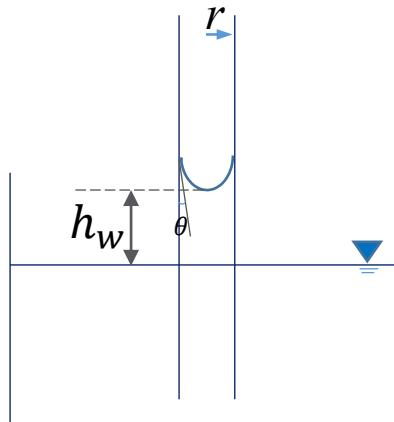

Take a photo or a video (< 2 min) in your day-to-day life that you think best illustrates some cool phenomena of porous media flow.

I will create a dropbox on D2L for you to upload the photo or video (due **April 26**).

Depending on the quality of your picture or video, you can receive up to 5 bonus points in your final grade (out of 100 points).

Air-water system in capillary tubes

Capillary rise in a Capillary tube

At the water table:

$$\left. \begin{array}{l} P_a = 0 \\ P_w = 0 \\ z = 0 \end{array} \right\} \Rightarrow H = 0$$

At the air-water interface in the tube:

$$\left. \begin{array}{l} P_a = 0 \\ z = h_w \\ H = 0 \end{array} \right\} \Rightarrow \varphi = -h_w \Rightarrow P_w = -P_w g h_w$$

$$P^{cap} = P_a - P_w = 0 - (-P_w g h_w) = P_w g h_w$$

Young-Laplace eqn: $P^{cap} = \frac{2\sigma \cos \theta}{r}$

$$\left. \begin{array}{l} P^{cap} = P_w g h_w \\ P^{cap} = \frac{2\sigma \cos \theta}{r} \end{array} \right\} \Rightarrow$$

$$h_w = \frac{2\sigma \cos \theta}{P_w g r}$$

Air-water system in capillary tubes

Capillary rise in a Capillary tube in the presence of an LNAPL (Assuming zero contacts)

At the oil-water interface:

$$P_w = \sigma - P_w g h_w = -P_w g h_w \quad \dots \dots \dots \quad (1)$$

$$P_o = P_{ow}^{cap} + P_w = \frac{2G_{ow}}{r} - P_w g h_w \quad \dots \dots \dots \quad (2)$$

continuing through the oil to the oil-air interface,
the oil pressure

$$P_o = \frac{2G_{ow}}{r} - P_w g h_w - P_o g (h_o - h_w) \quad \dots \dots \dots \quad (3)$$

At the oil-air interface:

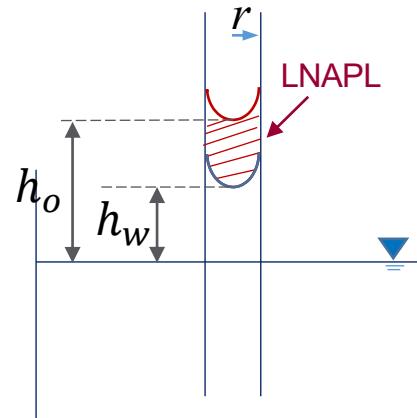

$$P_o = \sigma - P_{oa}^{cap} = -\frac{2G_{oa}}{r} \quad \dots \dots \dots \quad (4)$$

P_o in (3) and (4) are equal \Rightarrow

$$h_w = \left(\frac{2G_{ow}}{r} + \frac{2G_{oa}}{r} - P_o g h_o \right) / (P_w g - P_o g)$$

Note: w/o oil ($\sigma = 0$)

$$h_w = \frac{2G_{ow}}{P_w g r}$$

Air-water system in capillary tubes

Invasion of a nonwetting fluid into a pore (Assuming zero contacts)

At the air-oil interface:

$$P_o = P_a - P_{oa}^{cap} = - \frac{2\sigma_{oa}}{r_1}$$

continuing down to the oil-water interface, the pressure of oil is:

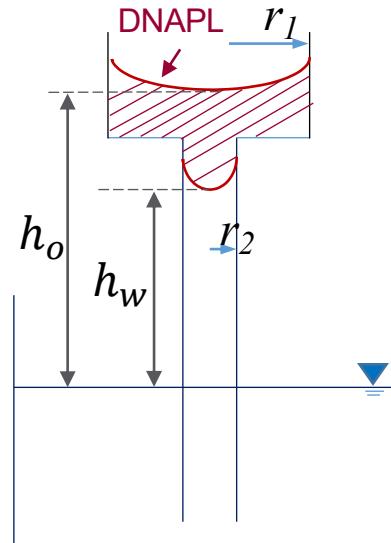

$$P_o = - \frac{2\sigma_{oa}}{r_1} + (h_o - h_w) \rho_o g$$

At the oil-water interface:

$$\begin{cases} P_{ow}^{cap} = P_o - P_w = - \frac{2\sigma_{ow}}{r_1} + (h_o - h_w) \rho_o g + \rho_w g h_w \\ P_{ow}^{cap} = \frac{2\sigma_{ow}}{r_2} \end{cases}$$

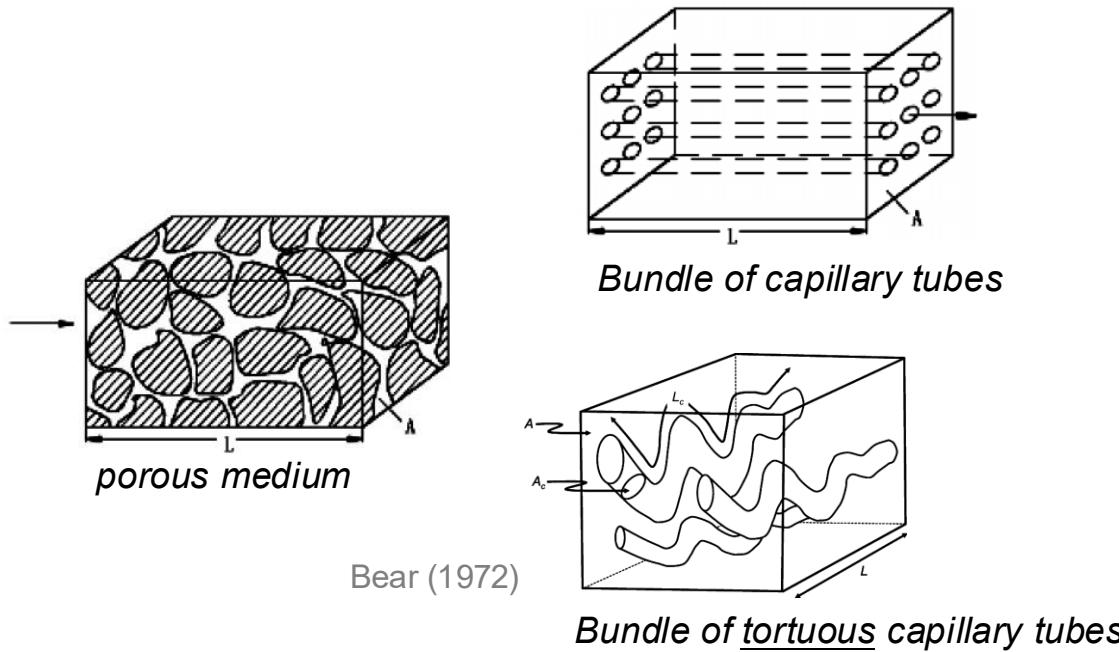

$$\Rightarrow h_o - h_w = \left[\frac{2\sigma_{ow}}{r_2} + \frac{2\sigma_{oa}}{r_1} - \rho_o g h_o \right] / (\rho_o g)$$

$$\Rightarrow h_w = \left[\frac{2\sigma_{ow}}{r_2} + \frac{2\sigma_{oa}}{r_1} - \rho_o g h_o \right] / [(\rho_w - \rho_o) g]$$

Air-water system in capillary tubes

Model of a porous medium as a Bundle of Capillary Tubes

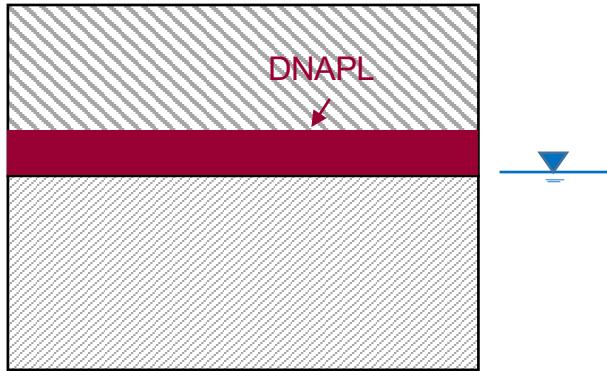

Bear (1972)

- ❖ Very simplified model, but its application has tremendously improved our understanding of fluid flow and transport phenomena in porous media.
- Some examples:
 - Permeability (already discussed)
 - Dispersion (already discussed)
 - Fluid invasion
 - Capillary transition zone
 - Soil water characteristic curve
 - Relative permeability

Air-water system in capillary tubes

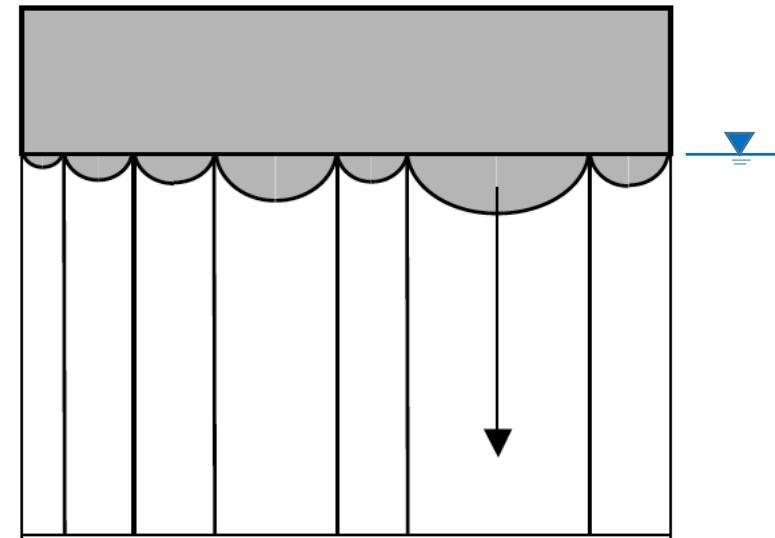

Invasion of a nonwetting fluid into an aquifer

1. Which is easier for DNAPL to invade?
Coarse sand or fine-grained medium?
2. For some reason, if DNAPL modifies the wettability of the porous medium grain surfaces, e.g., the contact angle of water increases from 0° to something between 0° and 90° .

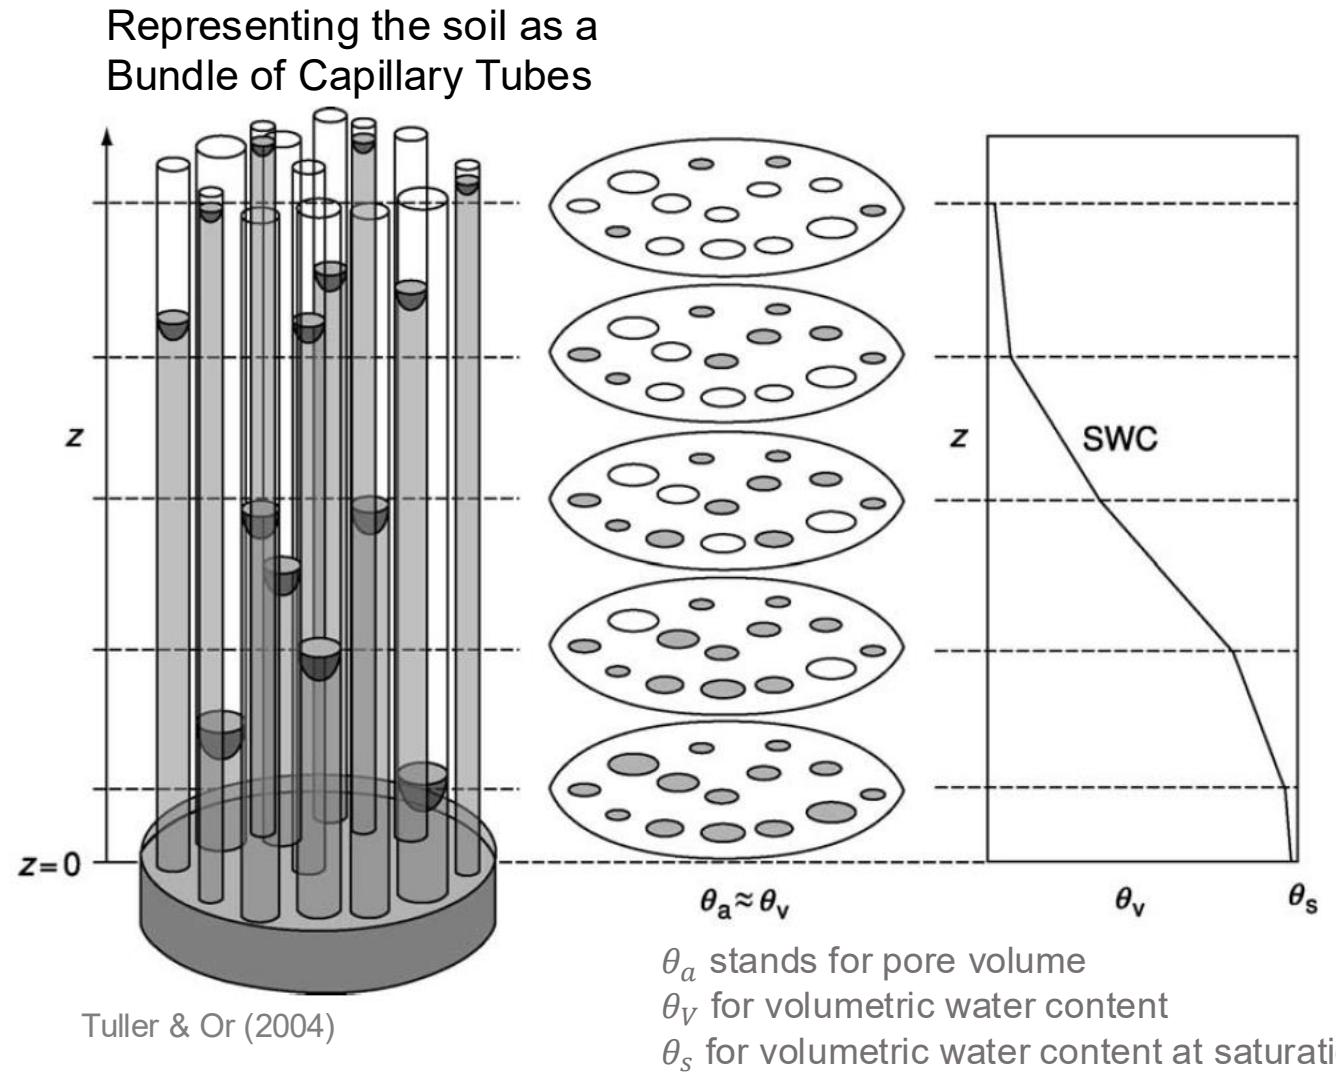

What may happen to the DNAPL?

Representing the aquifer as a bundle of capillary tubes

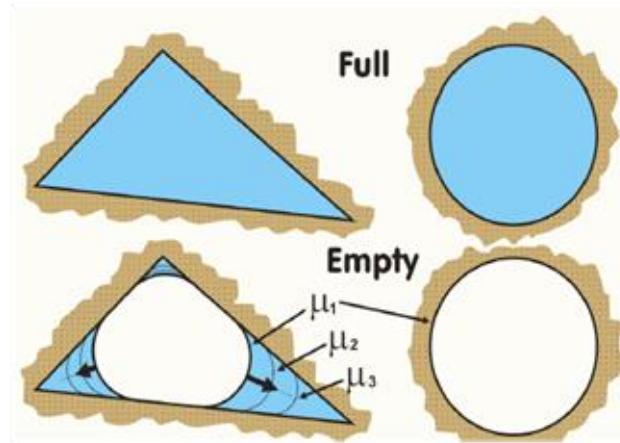

Air-water system in capillary tubes

Water retention (or capillary transition zone) in the vadose zone

Air-water system in capillary tubes

Bundle of triangular capillary tubes vs. bundle of cylindrical capillary tubes

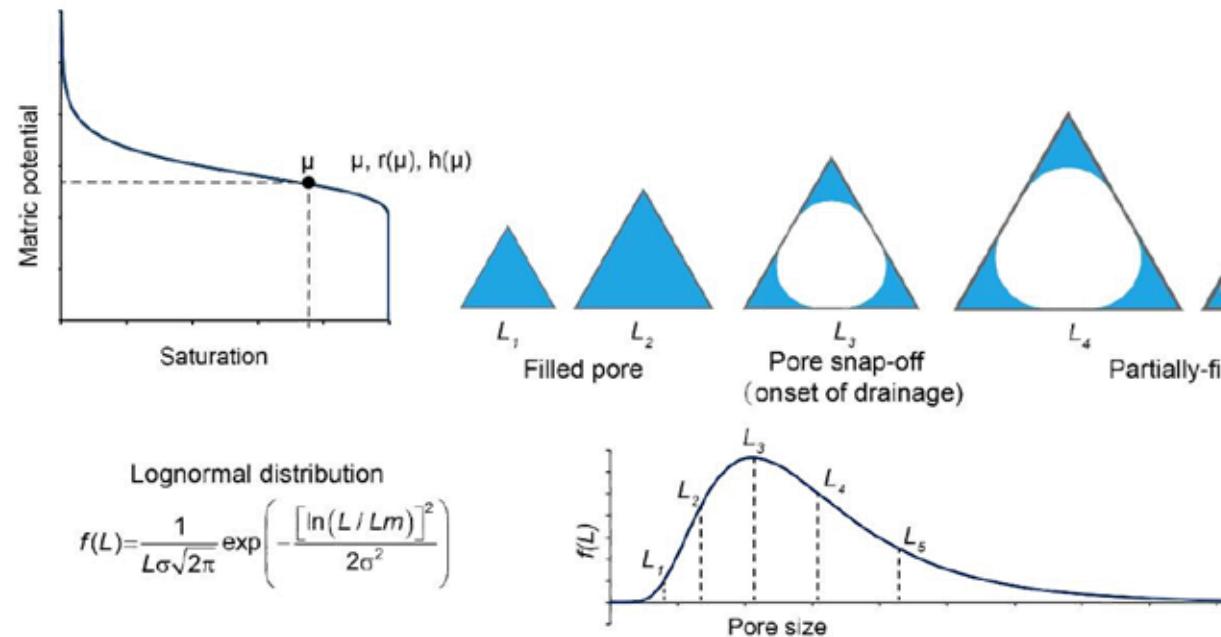

Bundle of triangular capillary tubes model have several advantages:

1. Can represent thin films and corner fluid
2. Saturation-dependent capillary pressure within a single-pore
3. More realistic representation of pore geometry
4. ...

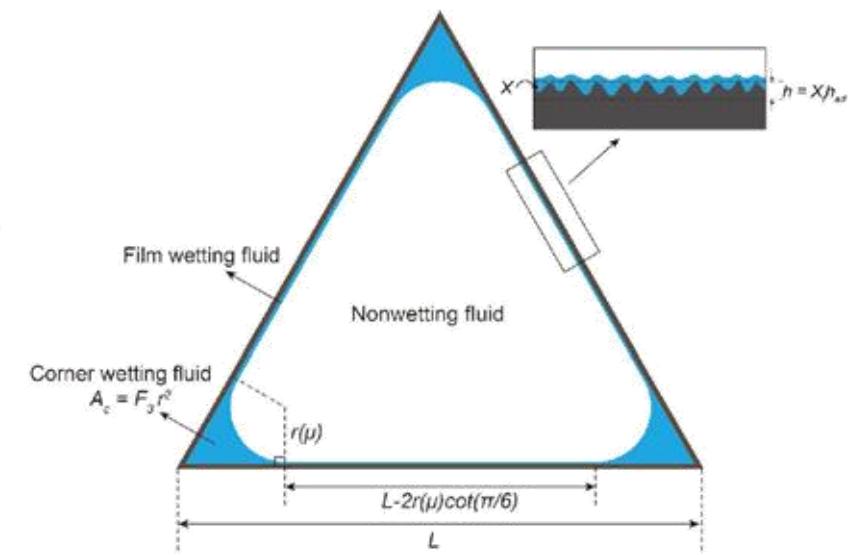

Tuller, Or, Dudley (1999)

Air-water system in capillary tubes
